

Deliverable 4

We had no issues implementing the rest of our test cases. This was because of the way we wrote the controlling script. As long as the test cases followed our template, they could easily be implemented into the testing framework. Because of this, no changes had to be made to any part of the testing framework, script or otherwise. We simply added the newly written test cases and respective drivers and everything was smooth sailing.

The main issue we did come across, however, was the lack of documentation for the Tanaguru project. There were typos and some random French and severely lacking comments. For example, the method `getConstrast` should be `getContrast`, this typo had to be carried over to our testing of the method to keep things consistent. The comments for methods seem like someone put the outline for a comment on each one yet never went back and actually wrote them, with only a few methods having minimal description. Despite this, we were able to find good methods to use for our purposes.

One could argue that the issues we have seen with the Tanaguru project make it perfect for testing, making it more likely that some problems may arise. This, along with our testing framework that makes it easy to add new tests, creates a good opportunity for testing experience.
